## *‘Database Management System’*

### PROJECT REPORT

Submitted To:

**Dr. R. Balaji Ganesh**

Submitted By:

**Sumit Parmar**  
Roll No. – 205119102  
MCA - II Semester ‘B’

# NATIONAL INSTITUTE OF TECHNOLOGY, TIRUCHIRAPPALLI-15

## CERTIFICATE

*This is to certify that **Mr. SUMIT PARMAR**, student of 2nd semester MCA (batch 2019-2022) of National Institute of Technology, Tiruchirappalli has successfully completed the project **STORE MANAGEMENT** in Tkinter(Python)/MySQL under the guidance of **Dr. R. BALAJI GANESH.***

Signature

**Dr. R. Balaji Ganesh**

# Abstract

The main aim of **Store Management** project is to keep a track of sales, purchases and their effect on inventory. We aim to demonstrate the use of create, read, select, update and delete MySQL operations through this project. The project starts by add items to the inventory by the seller, then a customer, purchase some products from seller (dealer) and note the changes to inventory. The purchased goods can be modified later which demonstrates the update functionality of project. Finally, we can record a sale and note the changes to product quantity in inventory page. The Application is built using Tkinter (Python) and MySQL technologies.

# **ACKNOWLEDGEMENT**

I have taken efforts in this project. However, it would not have been possible without the kind support and help of many individuals and organizations. I would like to extend my sincere thanks to all of them.

I am highly indebted to NIT, Trichy for their guidance and constant supervision as well as for providing necessary information regarding the project & also for their support in completing the project.

I would like to express my gratitude towards **Dr. R. Balaji Ganesh** for his kind co-operation and encouragement which help me in completion of this project.

**Dr. R. Balaji Ganesh**

(Department of Computer Applications)

# **INTRODUCTION**

A database management system (DBMS) refers to the technology for creating and managing databases. Basically DBMS is a software tool to organize (create, retrieve, update and manage) data in a database.

The main aim of a DBMS is to supply a way to store up and retrieve database information that is both convenient and efficient. By data, we mean known facts that can be recorded and that have embedded meaning. Normally people use software such as DBASE IV or V, Microsoft ACCESS, or EXCEL to store data in the form of database.

Database systems are meant to handle large collection of information. Management of data involves both defining structures for storage of information and providing mechanisms that can do the manipulation of those stored information. Moreover, the database system must ensure the safety of the information stored, despite system crashes or attempts at unauthorized access.

This project is aim at computerizing the manual process of wedding system. Front end and backend are implemented using Tkinter and MySQL respectively. The project consists of different forms(entity) namely Add, Update, Billing which are used for maintaining stock of store. The forms have number of entries. As well as each entry will be used to hold the information of items in the inventory.

## **The services of a Store Management System can include:**

- Holding information about the items in stock.
- Adding information of new stocks.
- Updating information of current stocks.
- Searching information of item with the ID.
- Generating Invoice of items purchased by the customer.
- Keeping records of daily transactions.

# Database Management System

DBMS stands for Database Management System. We can break it like this DBMS = Database + Management System. Database is a collection of data and Management System is a set of programs to store and retrieve those data. Based on this we can define DBMS like this: DBMS is a collection of inter-related data and set of programs to store and access those data in an easy and effective manner.

Database system are basically developed for large amount of data. When dealing with huge amount of data, there are two things that require optimization: Storage of data and retrieval of data. According to the principles of database systems, the data is stored in such a way that it acquires a lot less space as the redundant data(duplicate data) has been removed before storage.

Along with storing the data in an optimized and systematic manner, It is also important that we retrieve the data quickly when needed. Database system ensures that data is retrieved as quickly as possible.

## Applications of DBMS

The development of computer graphics has been driven both by the needs of the user community and by the advances in hardware and software. The applications of database are many and varied; it can be divided into four major areas

1. Hierarchical and network system
2. Flexibility with relational database.
3. Object oriented application.
4. Interchanging the data on the web for e-commerce.

# Display information

In this particular project, we have taken Tkinter as a front end in order to display the information which are stored in the backend database called MySQL.

Tkinter is the standard GUI library for Python. Python when combined with Tkinter provides a fast and easy way to create GUI applications. Tkinter provides a powerful object-oriented interface to the Tk GUI toolkit.

Creating a GUI application using Tkinter is an easy task. All you need to do is perform the following steps –

- Import the Tkinter module.
- Create the GUI application main window.
- Add one or more of the above-mentioned widgets to the GUI application.
- Enter the main event loop to take action against each event triggered by the user.

## User Interfaces

Our interactions with computers has become dominated by a visual paradigm that includes windows, buttons, menus, pointing device, such as a mouse. Although we are familiar with the syntax of MySQL, advances in MySQL have made possible other forms of advantages.

## What is MySQL?

MySQL is multithreaded, multi user SQL database management System (DBMS). The basic program run as server providing multiuser access to a number of databases. The project's source code is available under terms of the GNU(General Public Union), as well as under a variety of

property arguments. MySQL is a database. The data in a MySQL is stored in a Database objects called tables. A table is a collection of related data entries and it consists of columns and rows. The databases are useful when storing information categorically.

MySQL is a central components of the LAMP open source web application software stack (and other “AMP” stacks). LAMP is an acronym for Linux, Apache, MySQL, Perl/PHP/Python. Application that use the MySQL database include PyCharm, TYPO3, MODx, Joomla, WordPress, PHPBB, MyBB and Drupal. MySQL is also used in many high profile, large scale web sites, including Google(Though not for the searches).

## **MySQL Command Syntax**

As you might have observed from the simple program in the previous section, MySQL uses mainly uses six commands in which SELECT is used to retrieve rows selected from one or more tables. FROM refers to the table from which we need to select the attributes. WHERE clause, if given, indicates condition or conditions that rows must satisfy to be selected. where\_ condition is expression that evaluates to true for each row to be selected. This statement selects all rows if there is no where clause. GROUP BY clause used to group the values of the attributes provided that values must be same. HAVING clause is applied nearly last, just before items are sent to the client, with no optimization. If the HAVING clause refers to a column that is ambiguous, warning occurs. ORDER BY clause is used for the purpose of sorting the values of the attributes in a result. If you use GROUP BY, output rows are sorted according to GROUP BY columns as if you had an ORDER BY for the same columns.

## **Purpose**

The purpose of this project is to outline Inventory data and to recommend data management solutions and to provide a information regarding the stock. The purpose of this project is to develop a data management system to consolidate, organize, document, store and distribute information related to Store Management System.

A centralized database created to consolidate data, allowing integrated, long term analyses, and dynamic search ability with user friendly query tools to be performed to support adaptive management. Many data collection, analysis and presentation software programs that are currently being used must be able to interface with any new data management system. Continuity with consistent data collection methodology is enforced by a common database system, allowing for standardized format for forms ad reports between projects.

## **Scope**

The scope of the project is managing a consistency and storage of data by dedicated data administrator. It provides most of the features that a Database Management System should have. It is developed by using MySQL database. It has been implemented in WINDOWS platform.

## Hardware specification

Processor	:	i3 Core Processor
Clock speed	:	2.5GHz
Monitor	:	1024 * 768 Resolution Color
Keyboard	:	QWERTY
RAM	:	1 GB
Input Output Console for interaction		

## Software specification

MySQL Libraries	
MySQL Client Server	
PhyCham	
Operating system	: Windows7

# DESIGN OF THE PROJECT

This project has been developed using MySQL software which is queries oriented. Changes at the queries and the way in which it uses a system state may cause anticipated changes in the behaviour of other result.

## Schema and Tables Description

Following tables are used in the project:-

### 1. Inventory:

Field	Type	Null	Key	Default	Extra
id	int	NO	PRI	NULL	auto_increment
name	varchar(50)	NO		NULL	
stock	int	NO		NULL	
cp	int	YES		NULL	
sp	int	YES		NULL	
totalcp	int	YES		NULL	
totalsp	int	YES		NULL	
assumed_pofit	int	YES		NULL	
vendor	varchar(50)	YES		NULL	
vendor_phoneno	bigint	YES		NULL	

### 2. Transactions:

Field	Type	Null	Key	Default	Extra
id	int	NO	PRI	NULL	auto_increment
product_name	varchar(50)	NO		NULL	
quantity	int	NO		NULL	
amount	int	YES		NULL	
tdate	date	YES		NULL	

# IMPLEMENTATION

The project is implemented using MySQL database along with Tkinter.

## Implementation of Table Creation:

### 1. Inventory –

create table if not exists inventory

(id int not null auto\_increment, name varchar(50) not null,

stock int not null, cp int, sp int, totalcp int, tatalsp int,

assumed\_profit int, vendor varchar(50), vendor\_phoneno bigint,

primary key(id));

MySQL 8.0 Command Line Client

```
mysql> desc inventory;
```

Field	Type	Null	Key	Default	Extra
id	int	NO	PRI	NULL	auto_increment
name	varchar(50)	NO		NULL	
stock	int	NO		NULL	
cp	int	YES		NULL	
sp	int	YES		NULL	
totalcp	int	YES		NULL	
tatalsp	int	YES		NULL	
assumed_profit	int	YES		NULL	
vendor	varchar(50)	YES		NULL	
vendor_phoneno	bigint	YES		NULL	

```
10 rows in set (0.17 sec)
```

```
mysql>
```

## 2. Transactions –

create table if not exists transactions

(id int not null auto\_increment, product\_name varchar(50) not null, quantity int not null, amount int, tdate date, primary key(id));

MySQL 8.0 Command Line Client

```
mysql> desc transactions;
+-----+-----+-----+-----+-----+-----+
| Field      | Type          | Null | Key | Default | Extra           |
+-----+-----+-----+-----+-----+-----+
| id         | int           | NO   | PRI | NULL    | auto_increment |
| product_name | varchar(50)   | NO   |     | NULL    |                 |
| quantity   | int           | NO   |     | NULL    |                 |
| amount     | int           | YES  |     | NULL    |                 |
| tdate      | date          | YES  |     | NULL    |                 |
+-----+-----+-----+-----+-----+
5 rows in set (0.01 sec)

mysql>
```

## Project Description:

### DBMS Modules –

1. Inventory: As the name suggests, records of items are hold in this table with the help of Primary key(id).
2. Transactions: Each and every transactions happening in the store are placed in this table with their respective date of selling.

## **GUI Modules –**

1. Add items to Database: This form is used to add each and every item in the store to the inventory table of the store database by using insert query with their name, stock, cost price, selling price, total cost price, total selling price, vendor, vendor phone number.
2. Update information of items to database: This form is used to update information of any item present in the inventory table of store database with the help of it's item's id (Primary Key).
3. Search items: This form is used to search information about any item present in the database with it's item's id.
4. Generate Bill: This form is used to Generate Bill of all the items that a customer wants to buy and to calculate the total cost which is to be paid by the customer.
5. Change Button: This button is used to find how much change is to be returned to the customer if he paid more than the bill amount.
6. Print Invoice: By clicking generate a bill a process is initiated which will contact to the printing device so the invoice can be printed.
7. Clear Button: This Button is used to clear all entry field of the form.

# Snapshots

## 1. Form for Adding Item's Information's to Database:

The screenshot shows a web application window titled "Add To Database". The form contains the following fields and buttons:

- Enter Product Name
- Enter Stocks
- Enter Cost Price
- Enter Selling Price
- Enter Vendor Name
- Enter Vendor Phone Number
- Enter ID
- Clear All Fields (Red button)
- Add To Database (Blue button)

On the right side, a message box displays the following text:

```
ID has reached upto: 8
Inserted Colgate into the database with code 9
```

The Windows taskbar at the bottom shows the time as 8:07 AM on 7/13/2020.

## 2. Adding Item's Information's to Database:

**Add To Database**

Enter Product Name: Colgate

Enter Stocks: 500

Enter Cost Price: 20

Enter Selling Price: 25

Enter Vendor Name: Ram

Enter Vendor Phone Number: 7000863115

Enter ID: 9

Clear All Fields Add To Database

ID has reached upto: 8  
Inserted Colgate into the database with code 9

Success  
Successfully added to the Database.  
OK

Windows taskbar: 8:07 AM 7/13/2020

### 3. Form for Updating Item's Information's to Database:

The screenshot displays a web application window titled "Update To Database". The window has a light gray background and a title bar with standard minimize, maximize, and close buttons. The main content area features a large blue heading "Update To The Database" on the right side. On the left side, there is a form with the following labels and input fields:

- Enter ID: A text input field followed by a yellow "Search" button.
- Enter Product Name: A text input field.
- Enter Stocks: A text input field.
- Enter Cost Price: A text input field.
- Enter Selling Price: A text input field.
- Enter Total Cost Price: A text input field.
- Enter Total Selling Price: A text input field.
- Enter Vendor Name: A text input field.
- Enter Vendor Phone Number: A text input field.

At the bottom of the form, there are two buttons: a red "Clear All Fields" button and a blue "Update Database" button. To the right of the input fields, there is a large, empty white rectangular area. The bottom of the screenshot shows a Windows taskbar with various application icons and a system tray displaying the time "10:17 AM" and the date "7/13/2020".

## 4. Updating Item's Information's to Database:

Update To Database

### Update To The Database

Enter ID: 11

Enter Product Name: Dettol Soap

Enter Stocks: 600

Enter Cost Price: 20

Enter Selling Price: 25

Enter Total Cost Price: 12000

Enter Total Selling Price: 15000

Enter Vendor Name: Lakhan

Enter Vendor Phone Number: 9893567452

Success  
Database Updated!!!

Windows taskbar: 10:17 AM 7/13/2020

Windows taskbar: 8:26 AM 7/13/2020
